TO: CHR-Records Room

FROM: J. E. Farnham

SUBJECT: Exhibit specimen EX20 (file as 40-001)

On January 14, 1977, I received from Dr. Schlenker, a sealed tin can reported to contain a 239 Pu standard on a planchet. The can had a written label indicating 1.6 nCi 239 Pu and had been inspected and surveyed by the RER division's activity custodian, Dr. Robert Larson. The can has been assigned specimen number EX20.

Two documents were also received along with the tin can:

1. Shipping Document #B63570
2. A two-page (yellow sheets) hand written document.

The shipping report indicates the specimen was shipped from Pat Durbin from Berkeley to Dr. R. E. Rowland of Argonne. The written report indicates the amount of activity contained in the tin can, and states that the standard was prepared from the injection solution used on patient 40-001. These two documents are being sent, along with this memo, to the records room to be filed in the case folder of patient 40-001.
